

Commercial Space

Description

default watermark

In a stagnant world of few growth opportunities, the Commercial Space industry offers almost unlimited possibilities.

Here we are focused on commercial activities happening in space for space as opposed to satellite services provided to customers on Earth. This includes traditional aerospace activities like building and launching new satellites and space systems, but also new activities like space exploration and robotics, in-space servicing, assembly, and manufacturing (ISAM), space stations, space tourism, micro-gravity research, propellant depots, cislunar relays systems, lunar transportation systems, lunar and asteroid mining, in-situ resource utilization (ISRU), and eventually a space ecosystem extending to Mars and beyond.

Our Expertise

Near Earth's partners grew up in the aerospace industry and have 21 years of experience designing complicated satellite systems for major aerospace companies. On top of that technical base are decades of investment banking experience at major Wall Street firms. This rare combination is our special sauce.
